45DP168

Project Name

Credit Card Default Prediction

Abstract

This project focuses on predicting customer default payments in Taiwan using risk management techniques. Instead of a simple binary classification (credible or not credible), the goal is to estimate the probability of default for better decision-making. The K-S chart will be used to evaluate and identify high-risk customers who are likely to default on their credit card payments.

Domain

Data Science

Tools Used

Keggal notebook
